Lab Exercise 11:
Portal User Management in Hospital Management System (Zoho Creator)

Objective:

To create and configure a Portal User Management system in Zoho Creator for the Hospital Management System, enabling patients to access the portal securely through email invitations and password creation, with appropriate permissions for patient access.

Procedure:

1. Create and Configure Portal

The portal is created in Zoho Creator by selecting the Hospital Management System application. The portal provides an online interface through which patients can access the hospital application. The portal sign-in, sign-up, password creation, and password reset pages are configured to support user authentication and account management.

2. Add Portal Users and Assign Permissions

Portal users are added by entering their email addresses and names and assigning the appropriate permission profile. The notification email option sends an invitation to the user to join the Hospital Management System portal. The invited user creates a password through the email link to complete the registration process. The Patient permission profile is assigned to provide access according to the configured permissions

3. Create and Configure the Hospital Management Portal

The portal is created in Zoho Creator by selecting the Hospital Management System application. The portal provides an online interface through which users can access the application and its services. During configuration, the required application is selected from the available applications, and the portal is created. This helps provide a centralized access point for hospital-related information and services

4. Configure Portal Authentication and Password Management

The Hospital Management System portal provides authentication features to help users securely access the application. The Sign Up page allows new users to register by entering their name, email address, and captcha. The Sign In page allows registered users to begin the login process using their email address. The Create Password page enables users to set and confirm a password, while the Reset Password page helps users initiate password recovery through their registered email address. These pages provide a structured login and account management interface for the hospital portal.

5. Add Portal Users and Assign Permissions

The Portal Users feature in Zoho Creator allows administrators to add users to the Hospital Management System by entering their email address and name. While adding a user, the administrator can select the appropriate permission, such as Patient, to control the user's access to the portal. The system also provides an option to send a notification email to the user. After users are added, their details and assigned permissions can be viewed and managed from the Portal User section. This feature helps provide controlled access to the Hospital Management System for patients and other authorized users.

6. Set Up Portal User Invitation and Password Creation

The portal user invitation workflow sends an email invitation to the user's registered email address to access the Hospital Management System portal. The user clicks the Create New Password link, enters and confirms a password, and clicks Confirm to complete the signup process. This enables authorized users to securely access the portal using their login credentials.

7. Patient Registration Form

The Patient Registration Form in Zoho Creator is used to collect and maintain patient details in the Hospital Management System. It includes fields such as patient name, date of birth, gender, phone number, email, address, blood group, emergency contact, registration date, and blood group code. The form allows users to submit patient information and store it for future reference. Required field validation helps ensure that essential patient details are entered before submission, improving the accuracy and organization of patient records.

Result:

The Portal User Management system was successfully configured in Zoho Creator for the Hospital Management System. A portal was created, a patient user was invited through email, and the patient completed the password creation process. The Patient permission was assigned, enabling portal access with the configured role. This provides a foundation for secure patient access and user management.
