Appointment Email Notification Workflow – Hospital Management System

Objective:

To design and implement an Appointment Email Notification Workflow in Zoho Creator that validates appointment dates, sends email notifications upon successful appointment submission, and automates appointment reminders using Deluge scripting to improve appointment management in the Hospital Management System.

Procedure:

1. Validate Appointment Date:

The Validate Appointment Date workflow is created in Zoho Creator to prevent users from entering past dates for hospital appointments. When an appointment is created or edited, the workflow checks the selected appointment date against the current date. If the selected date is in the past, the system displays a validation message and prevents the invalid appointment from being submitted. This helps maintain accurate appointment records and ensures proper scheduling in the Hospital Management System..

2. Appointment Email Notification-(Deluge Script):

The Appointment Email Notification workflow is designed to send an email after an appointment record is submitted successfully in Zoho Creator. The workflow uses the successful form submission trigger and a Send Email action to notify the patient about the appointment. The email can include details such as the appointment date, appointment time, and status, helping patients receive confirmation and improving communication in the Hospital Management System.

3. Appointment Reminder Deluge Script

The Appointment Reminder Deluge Script is used to automate appointment reminder tasks in Zoho Creator. Deluge scripting allows the workflow to execute actions based on the configured appointment details and conditions. By configuring and saving the reminder script, the system can support timely appointment reminders and help reduce missed appointments. This improves appointment management and communication between the hospital and patients.

4) Final Workflow Page

The final workflow page displays the configured workflows in Zoho Creator for the Hospital Management System. It provides an overview of the workflow setup and helps verify that the appointment date validation, email notification, and reminder workflow configurations are available. This final review helps ensure that the workflow setup is organized and ready for testing.

Result:

Thus, the Hospital Management System workflows were configured in Zoho Creator to validate appointment dates, send appointment confirmation emails, and support automated appointment reminders using Deluge scripting. The final workflow page was reviewed to check the configured workflows. These features help improve appointment scheduling, patient communication, and overall hospital management.
