LAB EXERCISE 11
HOSPITAL MANAGEMENT SYSTEM APPROVAL PROCESS

Aim

To configure an approval process for the Appointment form in Zoho Creator so newly added appointment records can be reviewed by an authorized approver using Approve and Reject actions, with email notifications to the submitter.

Procedure

Open the Hospital Management System application in Zoho Creator and select Workflow, then Approvals. Create an approval workflow for the Appointment form, name it Appointment_Approval_Process, add a suitable approver, review the approval and rejection actions, save the configuration, and verify that the workflow is enabled.

1. Opening the Approvals Module

The Approvals tab is the starting point for configuring a record approval workflow in the existing Hospital Management System. From this section, a new approval process can be created for a selected form.

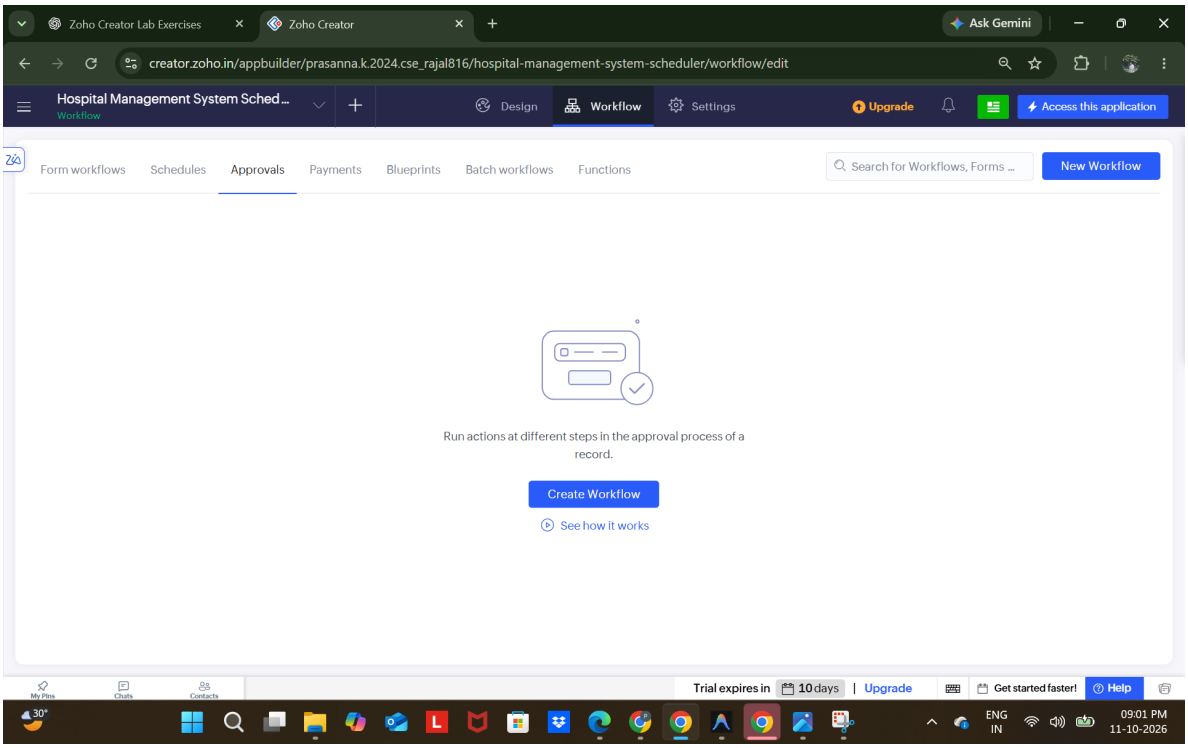

Figure 1: Opening the Approvals module before creating the approval workflow.

2. Starting the Approval Workflow

The record-addition setup screen is used to choose the form, name the approval workflow, and specify whether the process runs always or only when a condition is met.

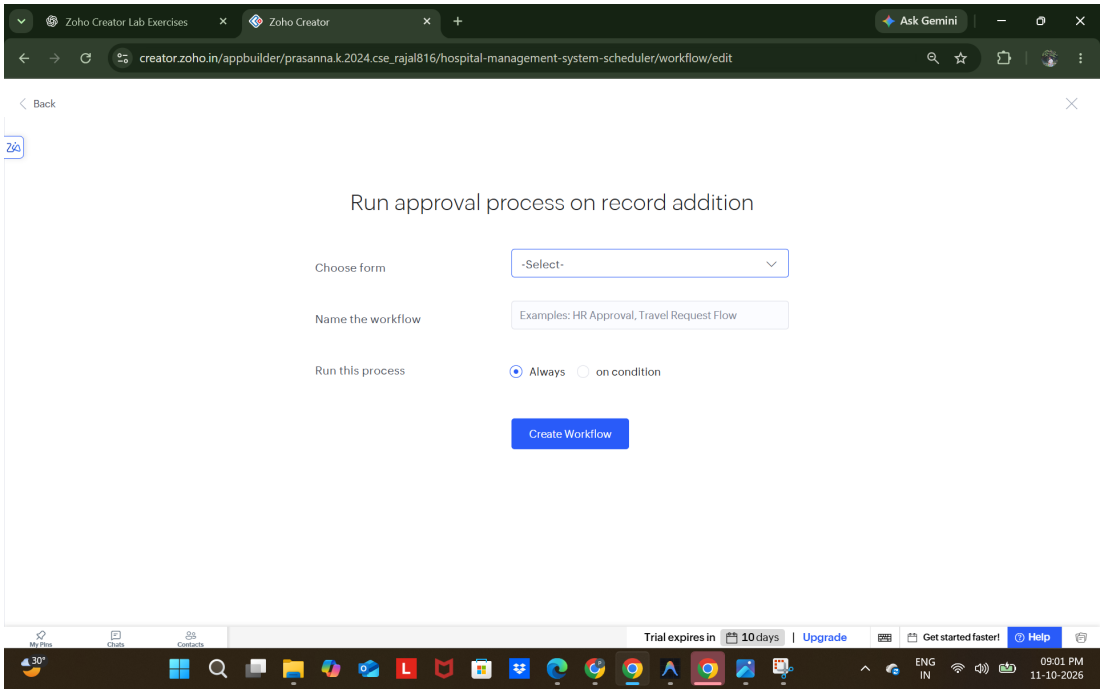

Figure 2: Initial setup screen for an approval workflow on record addition.

3. Selecting the Appointment Form

The Appointment form is selected and the workflow is named Appointment_Approval_Process. The Always option is selected so the approval process is applied whenever a new appointment record is added.

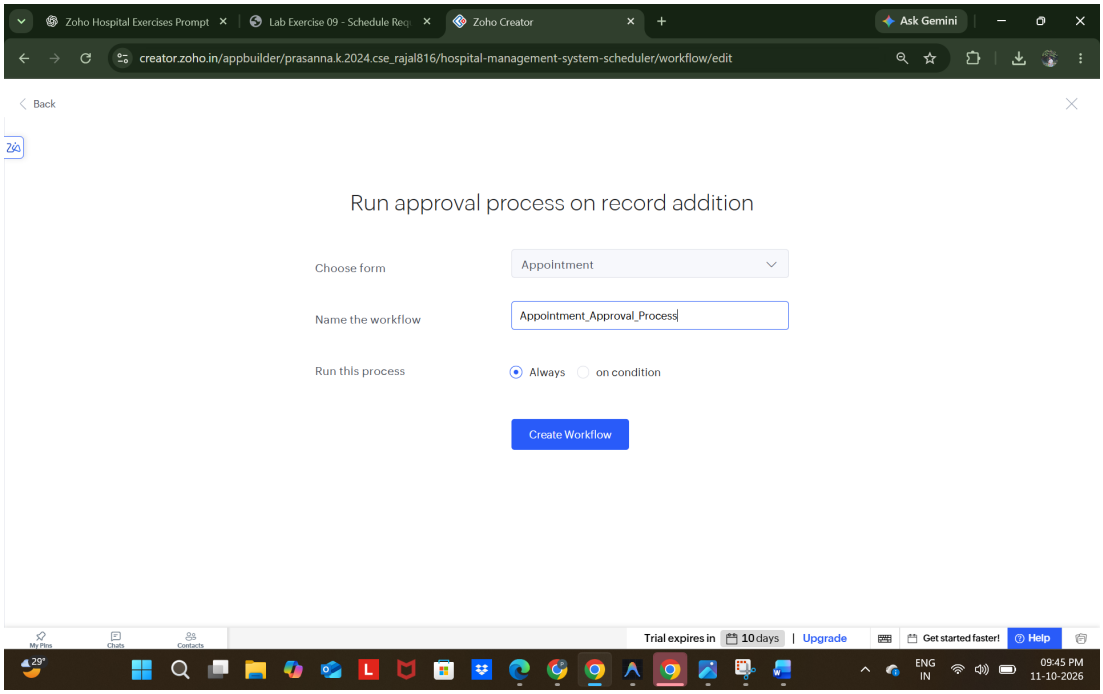

Figure 3: Appointment form and workflow name configured.

4. Adding an Approver

After the workflow is created, the builder prompts the user to add an approver. This approver reviews appointment records and makes the approval decision.

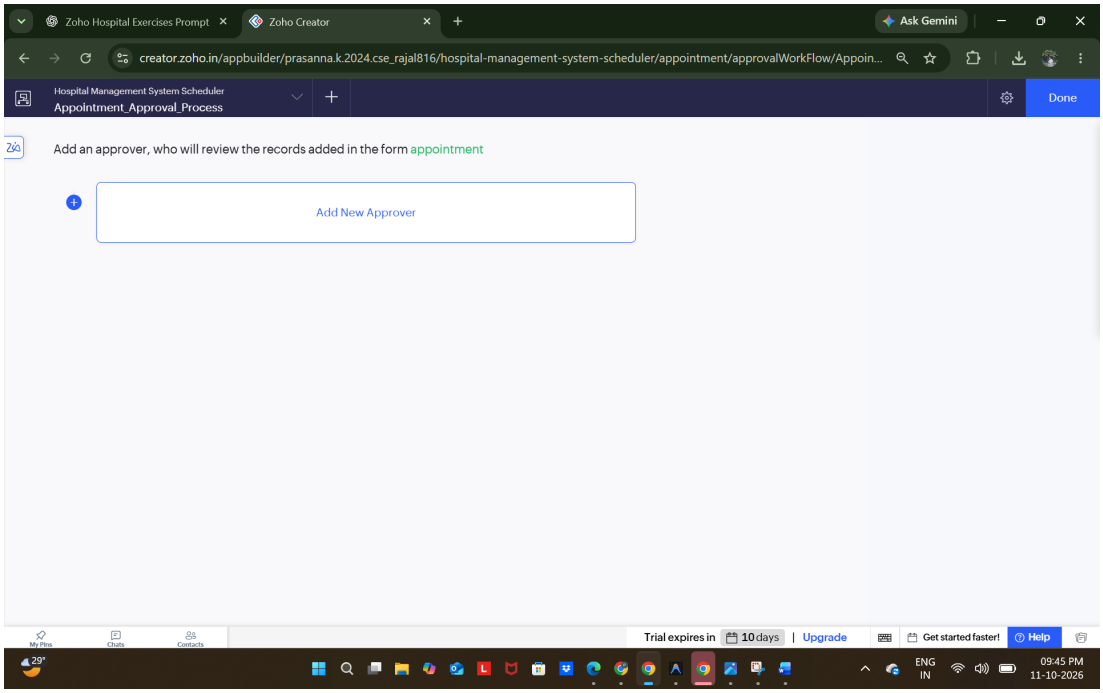

Figure 4: Approval workflow canvas before an approver is added.

5. Choosing the Approver Type

The Add New Approver panel provides the User option and fields for selecting an approver. The approval and denial labels are set to Approve and Reject. The final configuration uses a role-based approver.

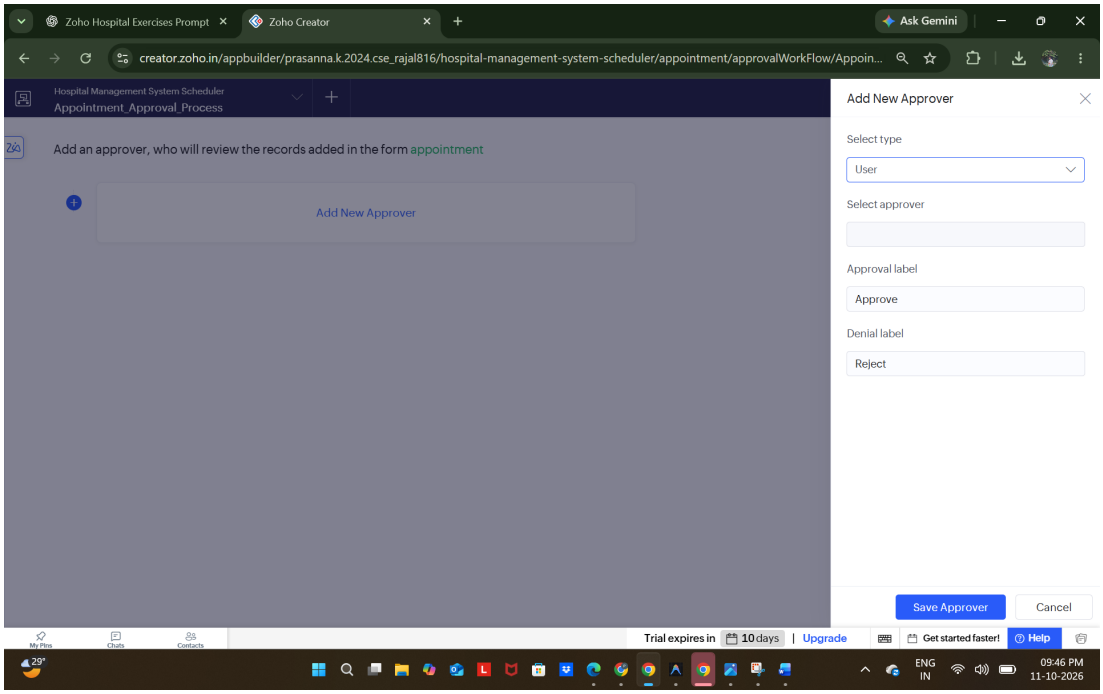

Figure 5: Approver configuration panel showing the User option.

6. Selecting a Role-Based Approver

The approver type is changed to Role and CEO is selected. The approval label remains Approve and the denial label remains Reject, defining the two available decision actions.

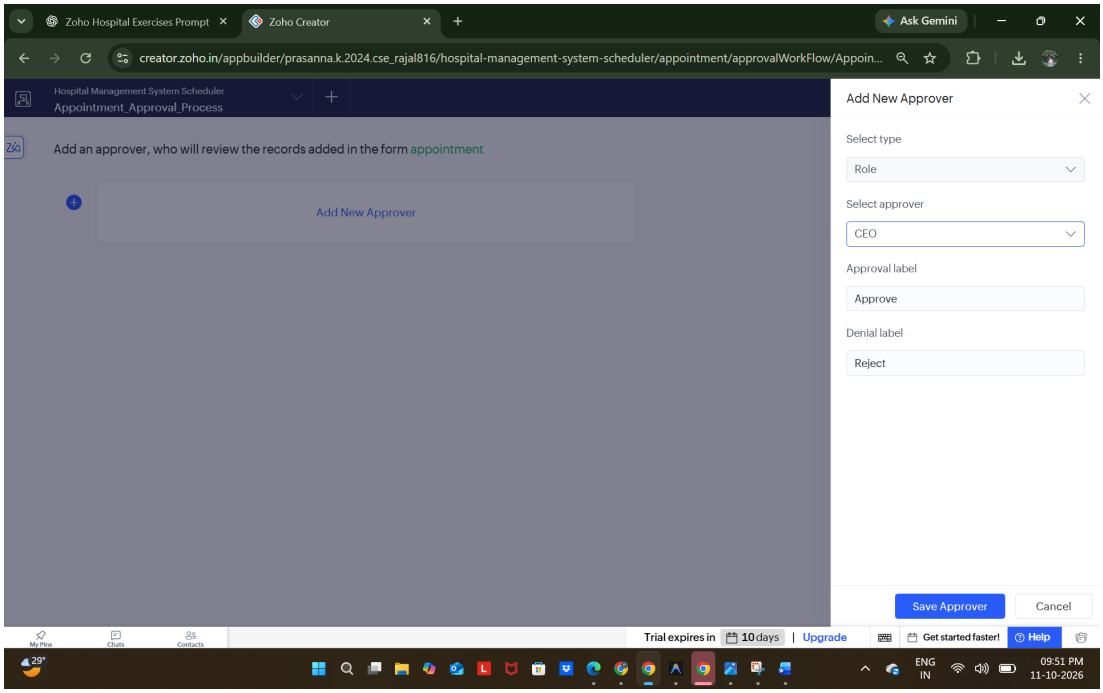

Figure 6: Role-based approver configured as CEO with Approve and Reject labels.

7. Reviewing the Approval Branches

The workflow canvas displays CEO as the Level 1 Approver. Separate Approve and Reject branches are available so that actions can be configured for either decision.

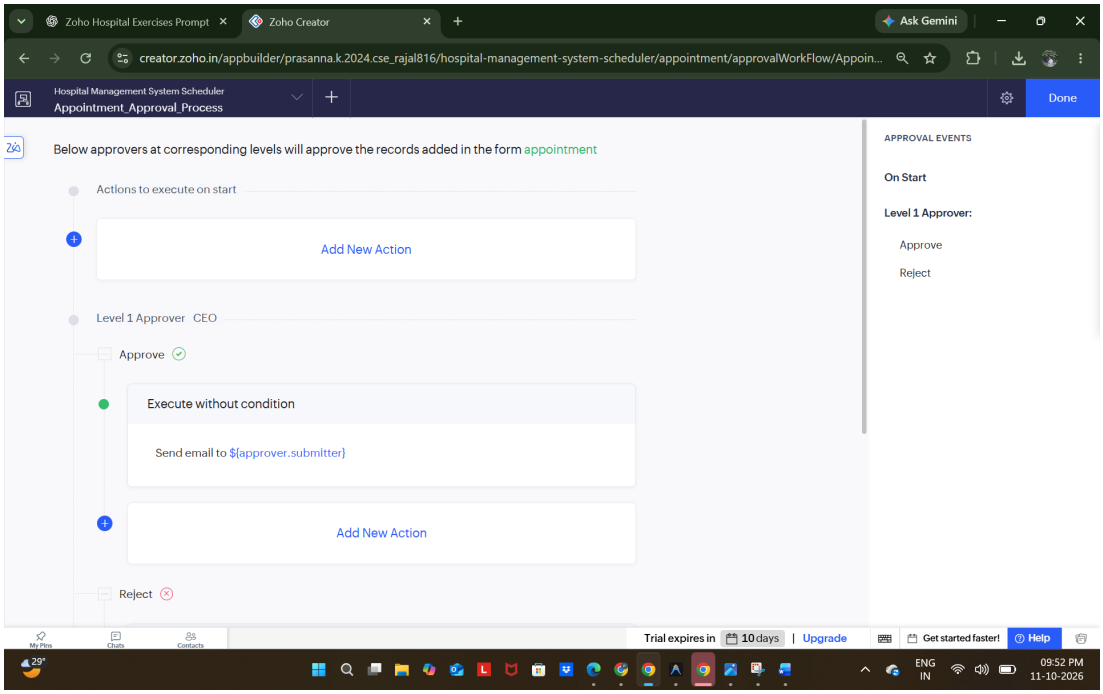

Figure 7: Approval workflow showing the Level 1 CEO approver and decision branches.

8. Reviewing the Decision Actions

Both decision branches include email actions to the submitter, and can be extended with additional actions or approvers.

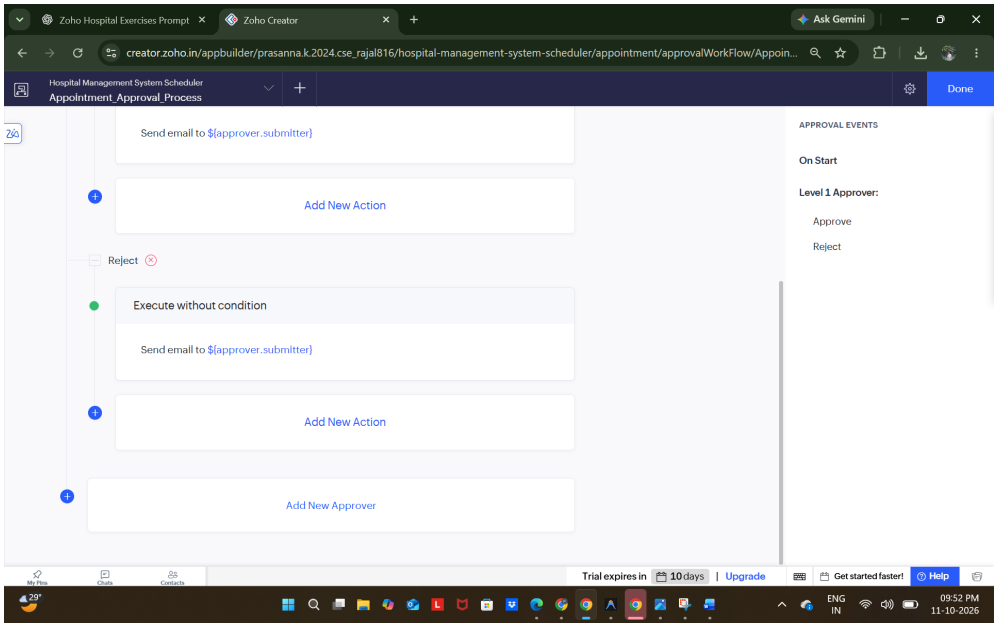

Figure 8: Approval and rejection branches with email actions for the submitter.

9. Verifying the Created Workflow

The list confirms Appointment_Approval_Process is enabled for Appointment and has two configured actions.

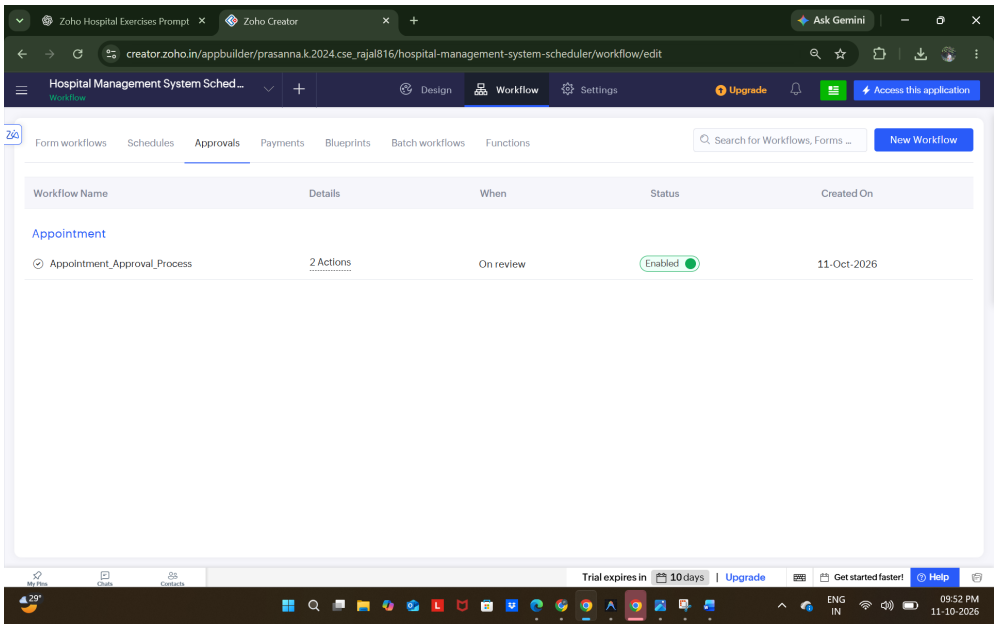

Figure 9: Appointment_Approval_Process displayed as enabled in the Approvals list.

Result

The Appointment_Approval_Process workflow was configured successfully in Zoho Creator. The Appointment form is assigned a role-based approver, CEO, with Approve and Reject decision branches and email actions for the submitter. The workflow appears as Enabled in the Approvals list.
