

LAB EXERCISE : 07

USER, ROLE AND PERMISSION MANAGEMENT IN ZOHO CREATOR FOR HOSPITAL MANAGEMENT SYSTEM

Aim

To configure user roles and permission profiles in the Hospital Management System using Zoho Creator and demonstrate role-based access by assigning suitable access, view, edit and delete permissions to different application roles.

Procedure

1. Open the existing Hospital Management System application in Zoho Creator and verify the dashboard and application reports.
2. Navigate to Settings → Users and Permissions → Permissions to create and manage permission profiles.
3. Configure module-level access for the required hospital forms such as Admission, Appointment, Billing, Patient, Prescription, Medicine and Room.
4. Navigate to the Roles section and define the organizational hierarchy for the application.
5. Create the required roles such as Admin, Doctor, Nurse/Staff, Receptionist, Pharmacist and Patient and assign their reporting relationships.
6. Associate suitable permission profiles with the corresponding roles and restrict modules that are not required for a role.
7. Save the role and permission configurations and verify that the application displays the expected access for each role.

OUTPUT / SCREENSHOTS

1. Admin Role Details and Access

The Admin role represents the highest-level application role and is configured to have broad access to application data and management functions.

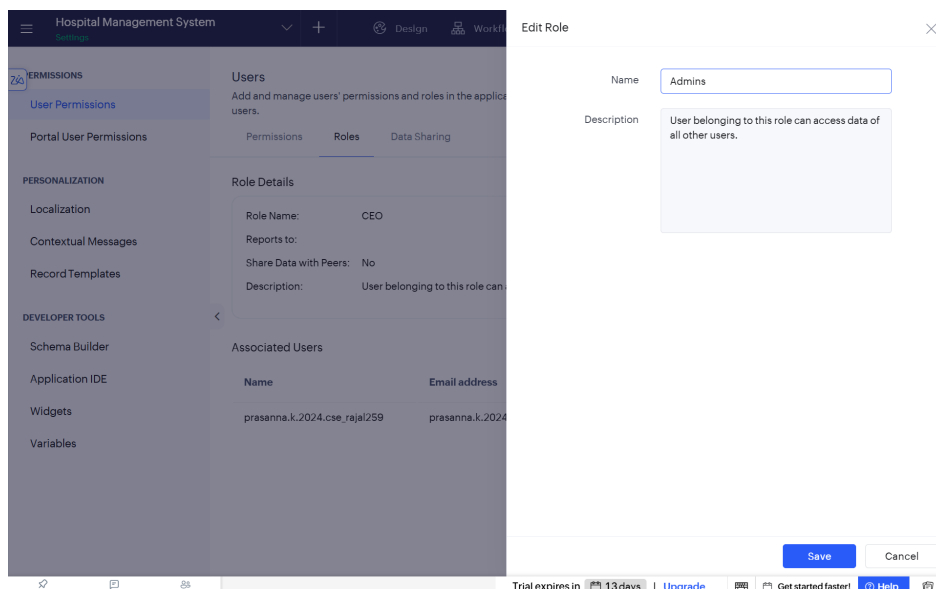

Figure 1: Admin Role Details and Access

2. Creating the Doctor Role

The Doctor role is created under the Admin level for managing patient and medical information within the application.

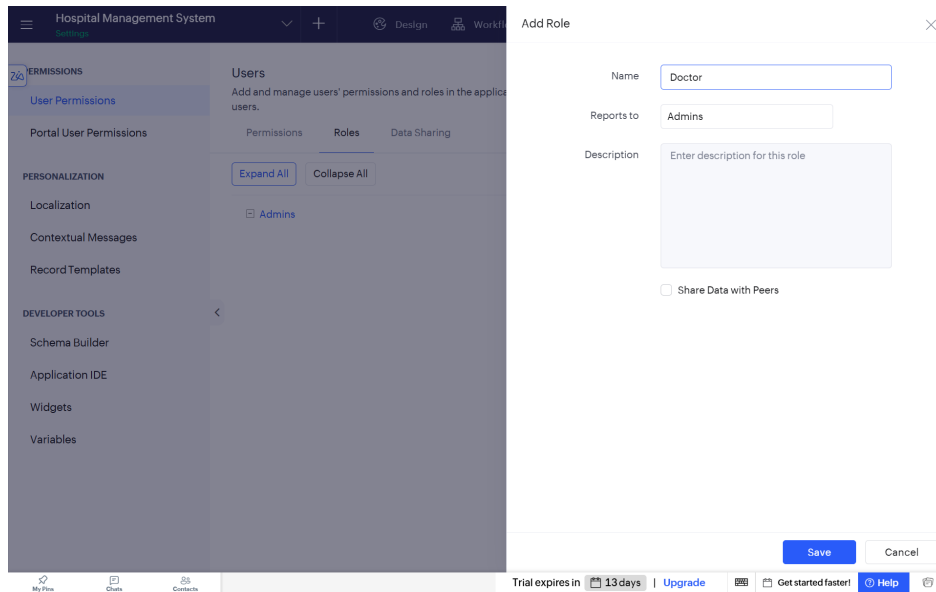

Figure 2: Creating the Doctor Role

3. Creating the Receptionist Role

The Receptionist role is created under the Admin level to handle front-office operations such as appointments, admissions and billing.

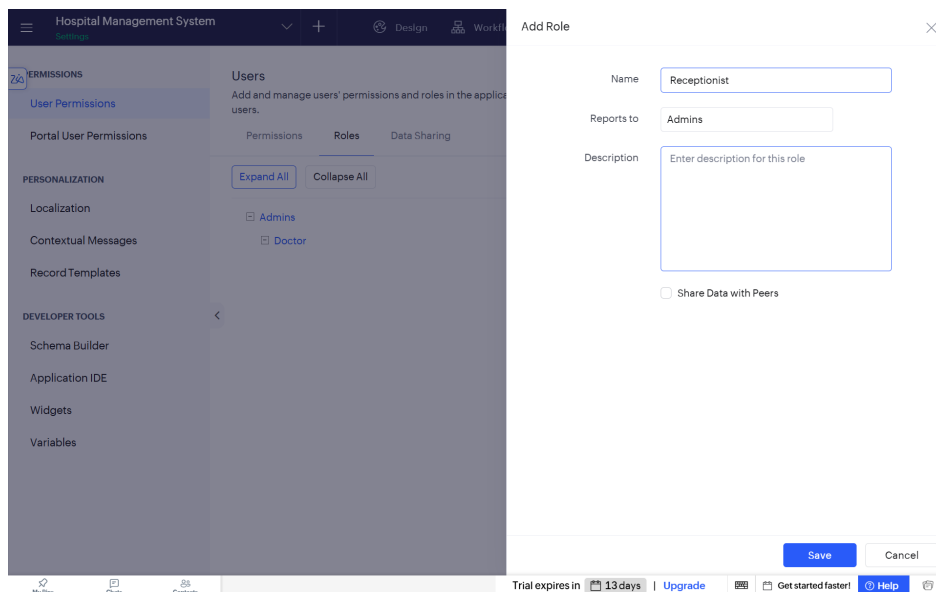

Figure 3: Creating the Receptionist Role

4. Creating the Pharmacist Role

The Pharmacist role is created and associated with the Admin level for managing medicine and prescription-related activities.

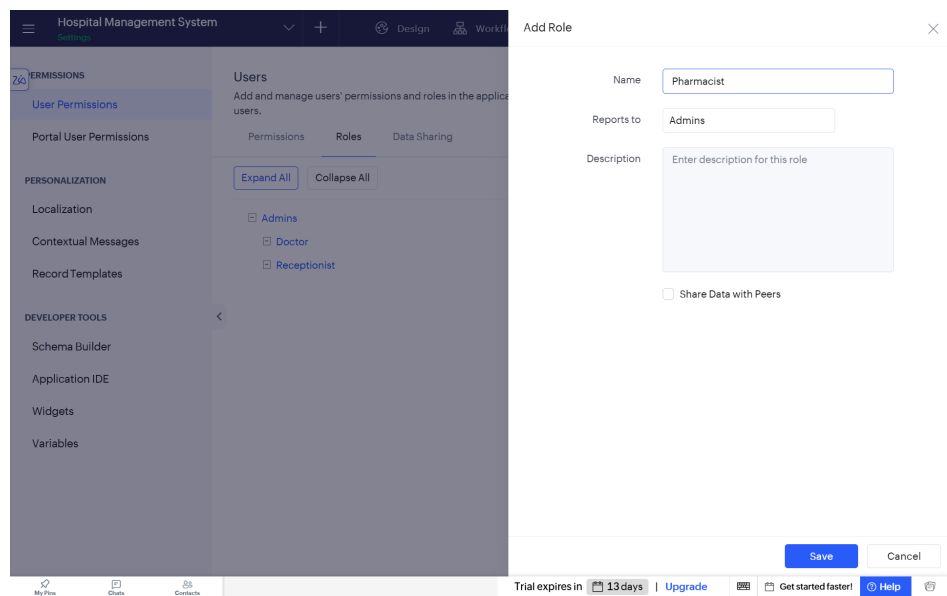

Figure 4: Creating the Pharmacist Role

5. Creating the Nurse / Staff Role

The Nurse / Staff role is created with Doctor as the reporting role, connecting clinical staff to the doctor level.

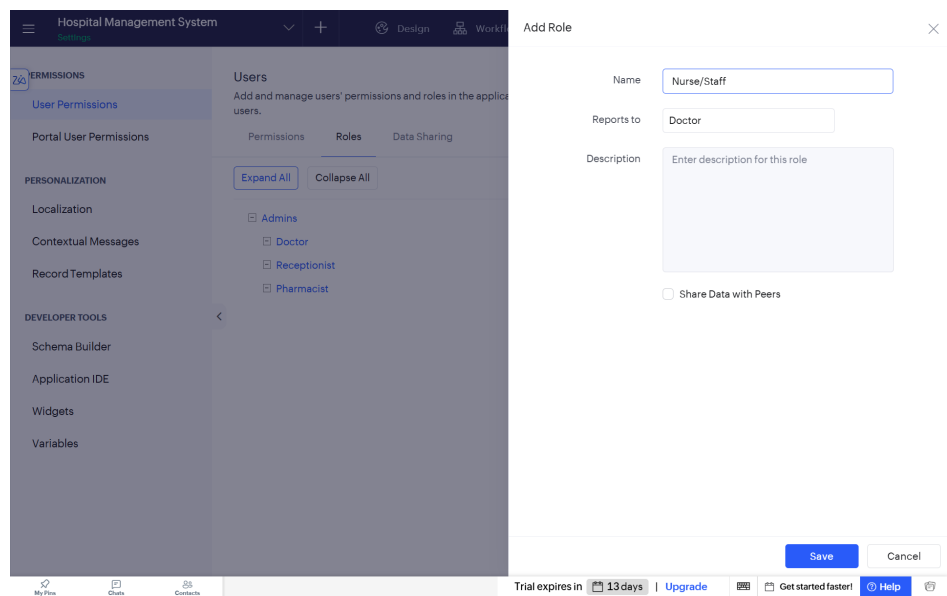

Figure 5: Creating the Nurse / Staff Role

6. Creating the Patient Role

The Patient role is created with Receptionist selected as the reporting role, establishing the required position in the hierarchy.

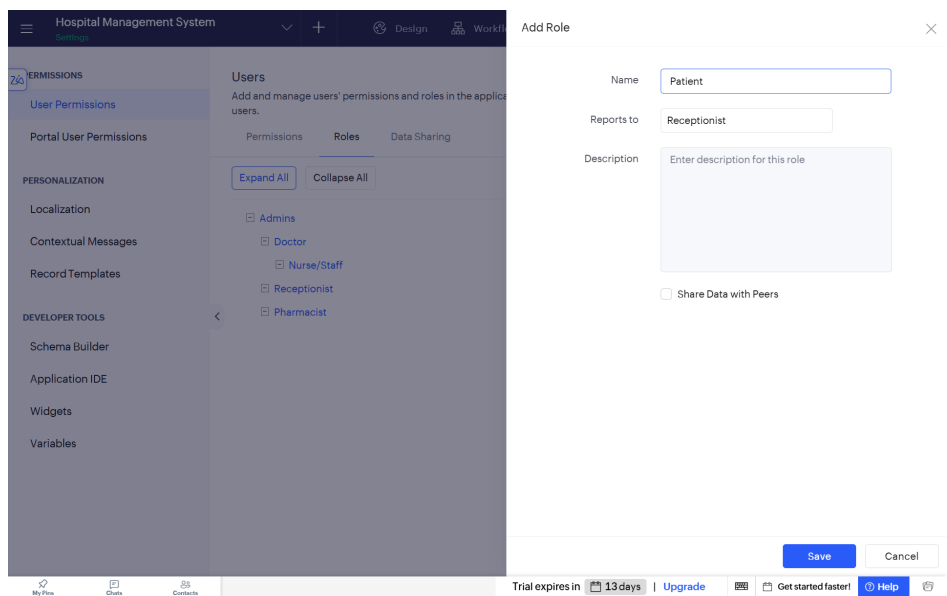

Figure 6: Creating the Patient Role

7. Role Hierarchy View

The Roles section displays the organizational hierarchy used in the Hospital Management System, with higher-level roles supervising related roles.

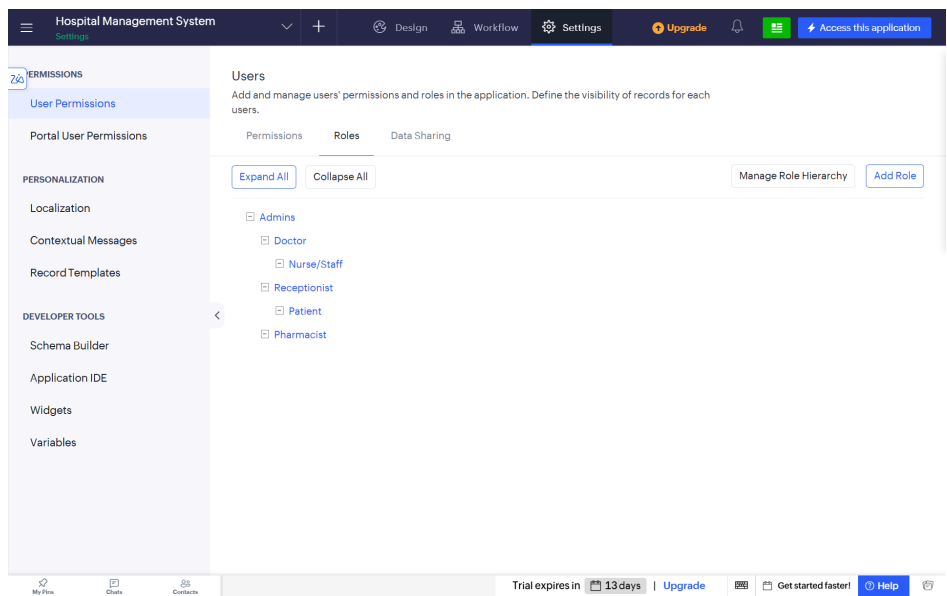

Figure 7: Role Hierarchy View

8. Permission Profile Details

The permission profile contains a description and module permissions, showing how access is organized before assigning the profile to users.

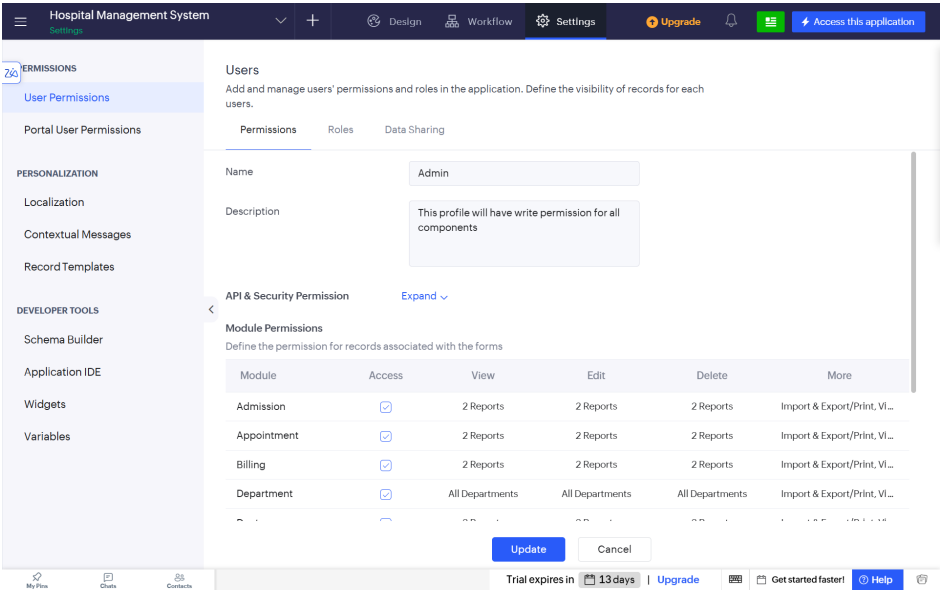

Figure 8: Permission Profile Details

9. Configuring Admission, Appointment and Patient Access

The permission set demonstrates selective access to admissions, appointments and patient information according to the responsibilities of the role.

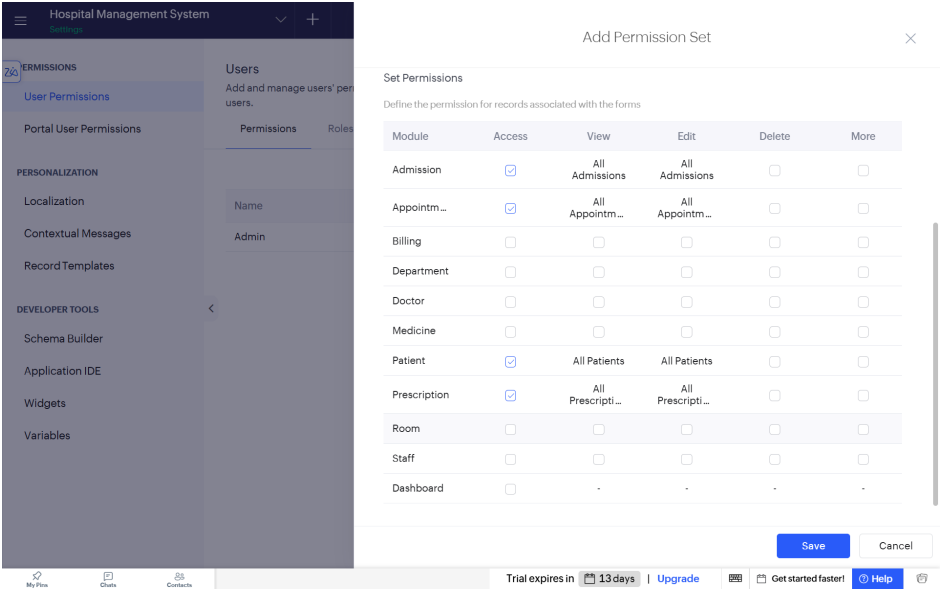

Figure 9: Configuring Admission, Appointment and Patient Access

10. Configuring Appointment and Patient Access

Appointment and patient records are assigned appropriate access and edit permissions while other modules remain restricted.

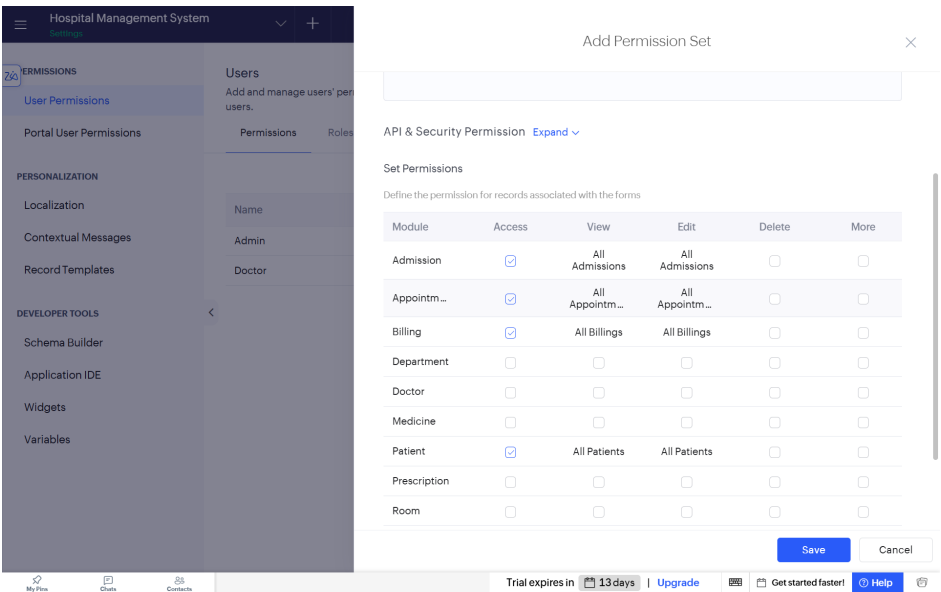

Figure 10: Configuring Appointment and Patient Access

11. Configuring Medicine and Prescription Access

Medicine and prescription modules are configured with the required access, view and edit options for the relevant application role.

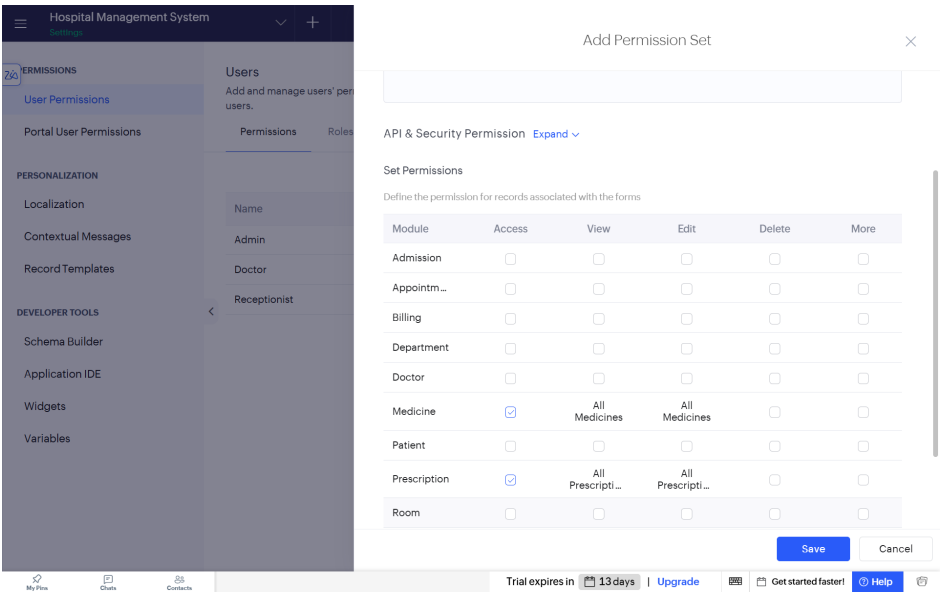

Figure 11: Configuring Medicine and Prescription Access

12. Configuring Additional Module Permissions

The permission configuration is continued for the required hospital modules. Access is granted only to the records needed by the corresponding user role.

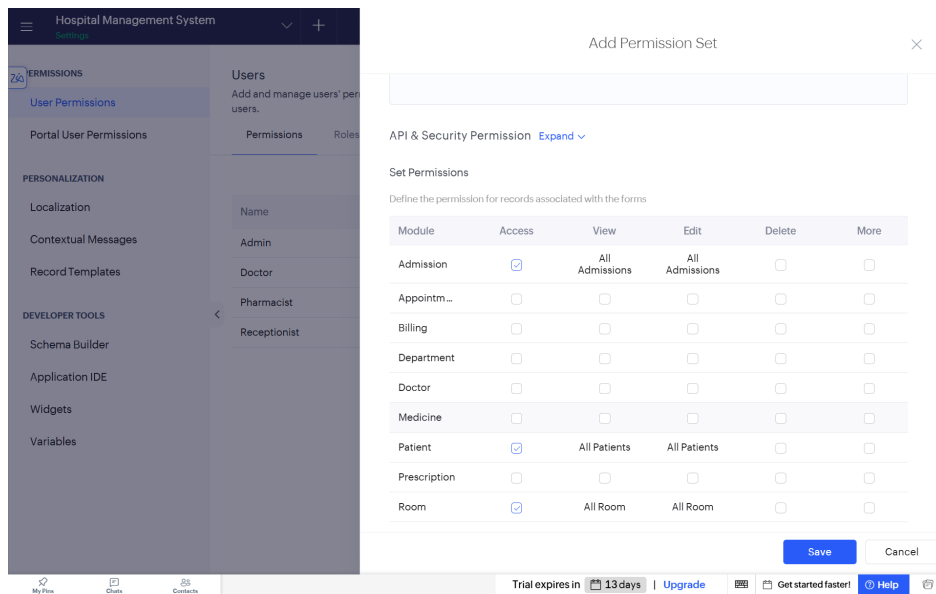

Figure 12: Configuring Additional Module Permissions

13. Module-Level Permission Configuration

A permission set is configured by selecting the required modules and defining access and view permissions for admissions, appointments, billing and prescriptions.

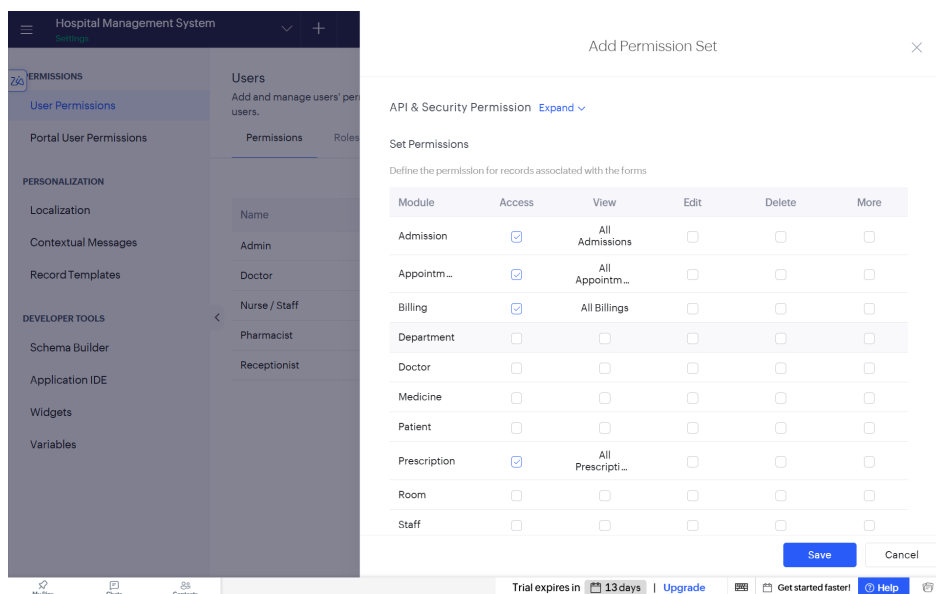

Figure 13: Module-Level Permission Configuration

14. Permission Profiles List

The User Permissions page lists the permission profiles created for the hospital application, providing separate access configurations for different users.

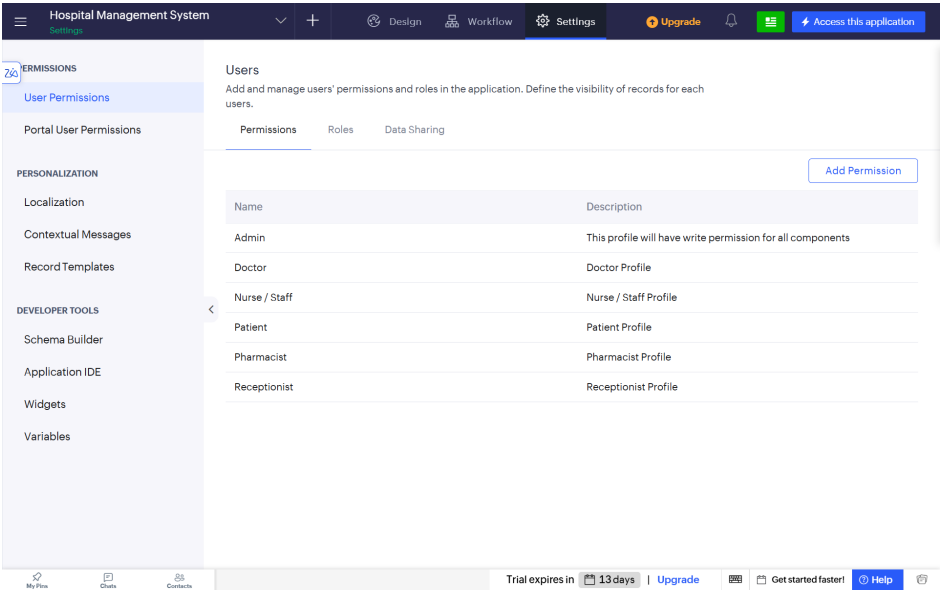

Figure 14: Permission Profiles List

15. Dashboard Summary and Visual Reports

The dashboard presents summary cards, appointment status, quick links and charts. This provides the working application context for role-based access.

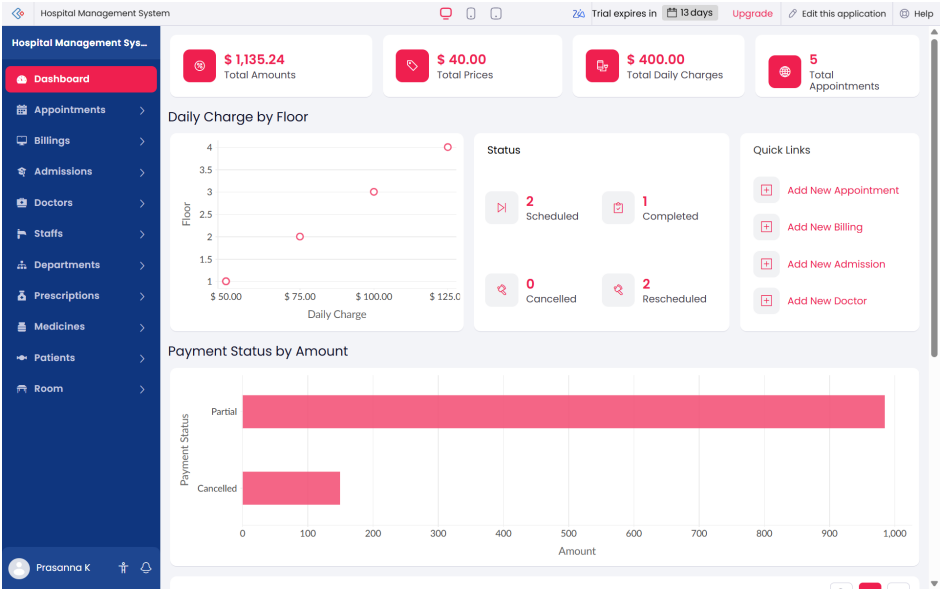

Figure 15: Dashboard Summary and Visual Reports

16. Application Dashboard and Appointment Report

The Hospital Management System dashboard and All Appointments report are displayed to confirm that the application contains operational data before access control is configured.

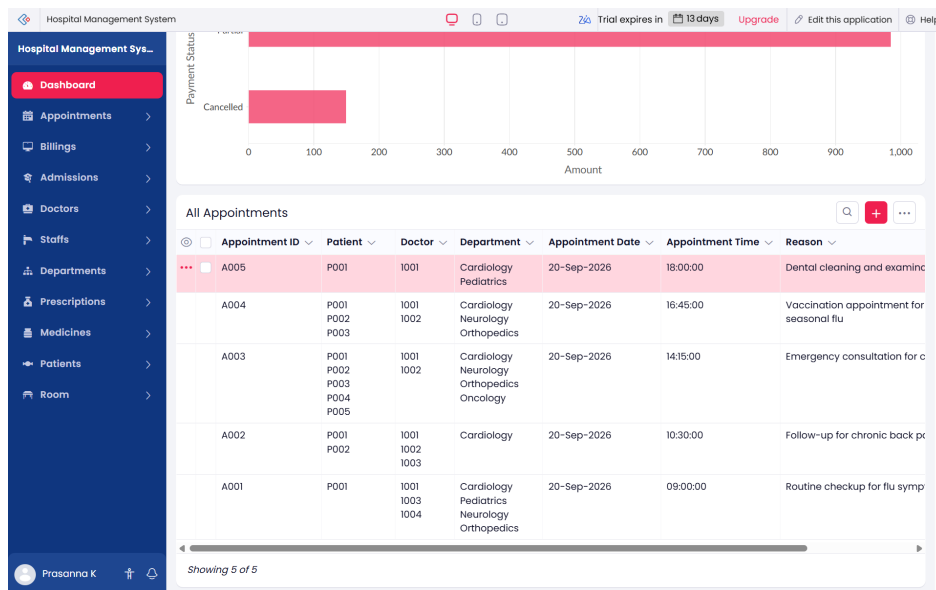

Figure 16: Application Dashboard and Appointment Report

Conclusion

The Hospital Management System was configured with role-based user management in Zoho Creator. Separate roles and permission profiles were created to control access to hospital modules. The role hierarchy and module-level permissions provide a structured method for controlling view, edit and other access rights according to each user role.
